

The Oklahoma Small Business Owners' Guide To IT Support and Services

What You Should Expect To Pay For IT Support For Your Small Business

(And How To Get *Exactly* What You Need Without
Unnecessary Extras, Hidden Fees And Bloated Contracts)

Read this guide and you'll discover:

- ✓ The three most common ways IT services companies charge for their services, and the pros and cons of each approach.
- ✓ A common billing model that puts ALL THE RISK on you, the customer, when buying IT services; you'll learn what it is and why you need to avoid agreeing to it.
- ✓ Exclusions, hidden fees and other "gotcha" clauses IT companies put in their contracts that you DON'T want to agree to.
- ✓ How to make sure you know exactly what you're getting to avoid disappointment, frustration and added costs later on that you didn't anticipate.
- ✓ revealing questions to ask your IT support firm BEFORE giving them access to your computer network, e-mail and data.

Never Ask An IT Services Company, "What Do You Charge For Your Services?" Instead You Should Ask, **"What Will I Get For My Money?"**

From The Desk Of: Craig Cummings
Business Technology Consultant of OK Computer LLC

Dear Colleague,

If you are the owner of a small business in Oklahoma that is currently looking to outsource some or all of the IT support for your small business, this report contains important information that will be extremely valuable to you as you search for a competent firm you can **trust**.

My name is Craig Cummings, Business Technology Consultant and Owner of OK Computer. We've been providing IT services to businesses in the Oklahoma area for over 8 years now. You may not have heard of us before, but I'm sure you're familiar with one or more of the other small businesses that are clients of ours. A few of their comments are enclosed.

One of the most common questions we get from new prospective clients calling our office is "What do you guys charge for your services?" Since this is such a common question – and a very important one to address – I decided to write this report for three reasons:

1. I wanted an easy way to answer this question and educate all prospective clients who come to us on the most common ways IT services companies package and price their services, and the pros and cons of each approach.
2. I wanted to bring to light a few "industry secrets" about IT services contracts and SLAs (service level agreements) that almost no Small Business Owner thinks about, understands or knows to ask about when evaluating IT services providers that can end up burning you with hidden fees and locking you into a long-term contract when they are unwilling or unable to deliver the quality of service you need.
3. I wanted to educate Small Business Owners on how to pick the **right** IT services company for their specific situation, budget and needs based on the **VALUE** the company can deliver, not just the price, high OR low.

In the end, my purpose is to help you make the most informed decision possible, so you end up working with someone who helps you solve your problems and accomplish what you want in a time frame, manner and budget that is right for you.

Dedicated to serving you,

Craig Cummings

Comparing Apples To Apples: The Predominant IT Service Models Explained

Before you can accurately compare the fees, services, and deliverables of one IT services company with another, you need to understand the three predominant service models most of these companies fit within. Some companies offer a blend of all three, while others are strict about offering only one service plan. The three predominant service models are:

- **Time and Materials.** In the industry, we call this "break-fix" services. Essentially you pay an agreed-upon hourly rate for a technician to "fix" your problem when something "breaks." Under this model, you might be able to negotiate a discount based on buying a block of hours. The scope of work may be simply to resolve a specific problem, like fixing a problem with your e-mail, or it may encompass a large project, like a network upgrade or move that has a specific result and end date clarified.
- **Managed IT Services.** This is a model where the IT services company takes the role of your fully outsourced "IT department" and not only installs and supports all the devices and PCs that connect to your server(s), but also offers phone and on-site support, antivirus, cyber security, backup, and a host of other services to monitor and maintain the health, speed, performance and security of your computer network.
- **Software Vendor-Supplied IT Services.** Many software companies will offer IT support for their customers in the form of a help desk or remote support for an additional fee. However, these are typically scaled-back services, limited to troubleshooting their specific application and NOT your entire computer network and all the applications and devices connected to it. If your problem resides outside of their specific software or the server it's hosted on, they can't help you and will often refer you to "your IT department." While it's often a good idea to buy some basic-level support package with a critical software application you use to run your business, this is not enough to provide the full IT services and support most businesses need to stay up and running.

When looking to outsource your IT support, the two service models you are most likely to end up having to choose between are the "managed IT services" and "break-fix" models. Therefore, let's dive into the pros and cons of these two options, and then the typical fee structure for both.

Managed IT Services Vs. Break-Fix: Which Is The Better, More Cost-Effective Option?

You've probably heard the famous Benjamin Franklin quote, "An ounce of prevention is worth a pound of cure." I couldn't agree more – and that's why it's my sincere belief that some form of managed IT is essential for every small business.

In our company, we offer different plans to fit the needs of our clients. In some cases, where the business is small, we might offer a very basic managed services plan to ensure the most essential maintenance is done, then bill the client hourly for any support used. For our smallest clients, they often find this the most economical. But for some of our midsize organizations, we offer a fully managed approach where more comprehensive IT services are covered in a managed plan. By doing this, we can properly staff for their accounts and ensure they get the fast, responsive support and expertise they need.

The only time I would recommend a "time and materials" approach is when you already have a competent IT person or team proactively managing your computer network and simply have a specific IT project to complete that your current in-house IT team doesn't have the time nor expertise to implement (such as migrating to a cloud-based solution, implementing a cyber security plan, etc.). Outside of that specific scenario, I do not think the break-fix approach is a good idea for general IT support for one very important, fundamental reason: you'll ultimately end up paying for a pound of "cure" for problems that could have easily been avoided with an "ounce" of prevention.

Why Regular Monitoring And Maintenance Is Critical For Today's Computer Networks

The fact of the matter is computer networks absolutely, positively need ongoing maintenance and monitoring to stay secure. The ever-increasing dependency we have on IT systems and the data they hold – not to mention the *type* of data we're now saving digitally – has given rise to very smart and sophisticated cybercrime organizations that work around the clock to do one thing: hack into your network to steal data or money or to hold you ransom.

As you may know, ransomware is at an all-time high because hackers make millions of tax-free dollars robbing one small business owner at a time. But that's not their only incentive.

Some will attempt to hack your network to gain access to bank accounts, credit cards or passwords to rob you (and your clients). Some use your computer network to send spam using YOUR domain and servers, host pirated software and, of course, spread viruses. Some even do it just for the "fun" of it.

And don't think for a minute these cybercriminals are solo crooks working alone in a hoodie out of their basement. They are highly organized and well-run operations employing *teams* of hackers who work together to scam as many people as they can. They use advanced software that scans millions of networks for vulnerabilities and use readily available data on the dark web of YOUR usernames, passwords, e-mail addresses and other data to gain access.

Of course, this isn't the only IT danger you face. Other common "disasters" include rogue employees, lost devices, hardware failures (still a BIG reason for data loss), fire and natural disasters and a host of other issues that can interrupt or outright destroy your IT infrastructure and the data it holds. Then there's regulatory compliance for any business hosting or touching

credit card or financial information, medical records and even client contact information such as e-mail addresses.

Preventing these problems and keeping your systems up and running (which is what managed IT services is all about) is a LOT less expensive and damaging to your organization than waiting until one of these things happens and then paying for emergency IT services to restore your systems to working order (break-fix).

Should You Just Hire A Full-Time IT Manager?

In most cases, it is not cost-effective for companies with under 40 employees to hire a full-time IT person for a couple of reasons.

First, finding and hiring good people is difficult; finding and hiring skilled IT people is incredibly difficult due to the skill shortage for IT. And if you're not technical, it's going to be very difficult for you to interview candidates and sift and sort through all the duds out there to find someone with good skills and experience. Because you're not technical, you might not know the right questions to ask during the interview process or the skills they need to do the job.

More often than not, the hard and soft costs of building an internal IT department for general IT support just don't provide the best return on investment for the average small to midsize business. An internal IT department typically doesn't make sense until you have closer to 40 employees OR you have unique circumstances and need specialized skills, a developer, etc., but not for day-to-day IT support and maintenance.

Why "Break-Fix" Works Entirely In The Consultant's Favor, Not Yours

Under a "break-fix" model, there is a fundamental conflict of interests between you and your IT firm. The IT services company has no incentive to prevent problems, stabilize your network or resolve problems quickly because they are getting paid by the hour when things stop working; therefore, the risk of unforeseen circumstances, scope creep, learning curve inefficiencies and outright incompetence are all shifted to YOU, the customer. Essentially, the more problems you have, the more they profit, which is precisely what you DON'T want.

Under this model, the IT consultant can take the liberty of assigning a junior (lower-paid) technician to work on your problem – one who may take two to three times as long to resolve an issue that a more senior (and more expensive) technician might resolve in a fraction of the time. There is no incentive to properly manage the time of that technician or their efficiency, and there is every reason for them to prolong the project and find MORE problems than solutions. Of course, if they're ethical and want to keep you as a client, they *should* be doing everything possible to resolve your problems quickly and efficiently; however, that's akin to putting a German shepherd in charge of watching over the ham sandwiches. Not a good idea.

Second, it creates a management problem for you, the customer, who now has to keep track of the hours they've worked to make sure you aren't getting overbilled, and since you often have no way of really knowing if they've worked the hours they say they have, it creates a situation where you really, truly need to be able to trust they are being 100% ethical and honest AND tracking THEIR hours properly (not all do).

What Should You Expect To Pay?

Important! Please note that the following price quotes are industry averages based on a recent IT industry survey conducted of over 750 different IT services firms. We are providing this information to give you a general idea of what most IT services firms charge and to help you understand the VAST DIFFERENCES in service contracts that you must be aware of before signing on the dotted line.

Hourly Break-Fix Fees: Most IT services companies selling break-fix services charge between \$100 and \$200 per hour with a one-hour minimum. In most cases, they will give you a discount of 5% to as much as 20% on their hourly rates if you purchase and pay for a block of hours in advance.

If they are quoting a **project**, the fees range widely based on the scope of work outlined. If you are hiring an IT consulting firm for a project, I suggest you demand the following:

- **A very detailed scope of work that specifies what "success" is.** Make sure you detail what your expectations are in performance, workflow, costs, security, access, etc. The more detailed you can be, the better. Detailing your expectations up front will go a long way toward avoiding miscommunications and additional fees later on to give you what you REALLY wanted.
- **A realistic estimate of the labor involved.** If most people are telling you it will take 20 hours, and someone else tells you they can do it in 5 hours, ask them how they plan to do it so much faster than everyone else. Do they have a better process or tool? How many similar projects have they completed successfully?
- **A detailed project plan that outlines the major milestones.** If they don't have a project plan outlining the major milestones, this should be a big red flag. How can their estimates possibly be realistic if they haven't even bothered to outline the steps involved?

Managed IT Services: Most managed IT services firms will quote you a MONTHLY fee based on the number of devices they need to maintain, back up, support, etc. In Oklahoma, that fee is somewhere in the range of \$250 to \$350 per server, \$100 to \$300 per desktop and approximately \$50s per smartphone or mobile device.

If you hire an IT consultant and sign up for a managed IT services contract, here are some things that SHOULD be included, at a bare minimum (make sure you read your contract to validate this):

- **Security patches** applied weekly, if not daily, for urgent and emerging threats
- **Antivirus** updates and monitoring
- **Firewall** updates and monitoring
- **Backup** monitoring and test restores
- **Spam-filter** installation and updates
- **Monitoring** workstations and servers for signs of failure
- **Documentation** of your network, software licenses, credentials, etc.

The following services may **NOT be included** and will often be billed separately. This is not necessarily a "scam" or unethical UNLESS the managed IT services company tries to hide these fees when selling you a service agreement. Make sure you review your contract carefully to know what is and is NOT included!

- Hardware, such as new servers, PCs, laptops, etc.
- Software licenses
- Special projects
- Moves, Adds, and Changes (e.g. moving to a new office, adding a new server, etc.)

Warning! Beware the gray areas of "all-inclusive" service contracts. In order to truly compare the "cost" of one managed IT services contract with another, you need to make sure you fully understand what IS and ISN'T included AND the "SLA" or "service level agreement" you are signing up for. It's VERY easy for one IT services provider to appear far less expensive than another UNTIL you look closely at what you are getting.

The following are 18 questions to ask your IT services provider that will clarify exactly what you're getting for the money. Some of these items may not be that important to you, while others (like response time, adequate insurance and uptime guarantees) may be critical. Make sure you fully understand each of these items before making a decision about who the right provider is for you, then make sure you get this IN WRITING.

10 Questions You Should Ask Your IT Services Company Or Consultant Before Hiring Them For IT Support

Customer Service:

Q1: When I have an IT problem, how do I get support?

Our Answer: When a client has a problem, we "open a ticket" in our IT management system so we can properly assign, track, prioritize, document and resolve client issues. However, some IT firms force you to log in to submit a ticket and won't allow you to call or e-mail them. This is for THEIR convenience, not yours. Trust me, this will become a giant inconvenience and thorn in your side. While a portal is a good option, it should never be your ONLY option for requesting support.

Also, make sure they HAVE a reliable system in place to keep track of client "tickets" and requests. If they don't, I can practically guarantee your requests will sometimes get overlooked, skipped and forgotten.

Requesting support should also be EASY for you. So be sure to ask how you can submit a problem to their support desk for resolution. We make it easy. Calling, e-mailing, or submitting a ticket via our portal puts your IT issue on the fast track to getting resolved.

Q2: Do you offer after-hours support?

Our Answer: Any good IT company will answer their phones LIVE (not voice mail or phone trees) and respond from 8:00 a.m. to 5:00 p.m. every weekday. But many CEOs and executives work outside normal "9 to 5" hours and need IT support both nights and weekends. That's why our helpdesk is available 24/7.

IT Maintenance (Managed Services):

Q3: Do you offer true managed IT services and support?

Our Answer: You want to find an IT company that will proactively monitor for problems and perform routine maintenance on your IT systems. If they don't have the ability to do this, or they don't offer it, we strongly recommend you look somewhere else. Our remote network monitoring system watches over your network to constantly look for developing problems, security issues and other problems so we can address them BEFORE they turn into bigger problems.

Q4: What is NOT included in your managed services agreement?

Our Answer: Another "gotcha" many IT companies fail to explain is what is NOT included in your monthly managed services agreement that will trigger an invoice. Their so-called "all you can eat" option is RARELY true – there are limitations to what's included and you want to know what they are BEFORE you sign.

Other things to inquire about are:

- Do you offer truly unlimited help desk? (Make sure you are not nickel-and-dimed for every call.)
- Does the service include support for cloud services such as Microsoft 365?
- Do you charge extra if you have to resolve a problem with a line-of-business application, Internet service provider, phone system, leased printer, etc.? (**What you want is an IT company that will own the problems and not point fingers. We are happy to call the vendor or software company on your behalf.**)
- What about on-site support calls? Or support to remote offices?
- If we were to get ransomed or experience some other disaster (fire, flood, theft, tornado, hurricane, etc.), would rebuilding the network be included in the service plan or considered an extra project we would have to pay for? (Get this IN WRITING. Recovering from such a

disaster could take hundreds of hours of time for your IT company's techs, so you want to know in advance how a situation like this will be handled before it happens.)

Our managed services agreement is completely transparent and includes unlimited support for managed devices and covered applications.

Q5: Do you offer documentation of our network as part of the plan, and how does that work?

Our Answer: Network documentation is exactly what it sounds like: the practice of maintaining detailed technical records about the assets you own (computers, devices, software, directory structure, user profiles, passwords, etc.) and how your network is set up, backed up and secured. Every IT company should provide this to you in both written (paper) and electronic form at no additional cost and update it on a quarterly basis.

Why is this important? There are several reasons:

First, it shows professionalism and integrity in protecting YOU. No IT person or company should be the only holder of the keys to the kingdom. Because we document your network assets and passwords, you have a blueprint you can give to another IT person or company to take over if necessary.

Second, good documentation allows the engineers working on your account to resolve problems faster because they don't waste time fumbling their way around your network trying to find things and uncover accounts, hardware, software licenses, etc. Third, if you had to restore your network after a disaster, you'd have the blueprint to quickly put things back in place as they were.

Finally, and most important, if you ever need to switch IT providers, your replacement company will be able to take over quickly because the network has been documented properly.

All our clients receive this in written and electronic form at no additional cost. We also perform a quarterly update on this material and make sure certain key people from your organization have this information and know how to use it, giving you complete control over your network.

Side note: You should NEVER allow an IT person to have that much control over you and your company. If you get the sneaking suspicion that your current IT person is keeping this under their control as a means of job security, get rid of them (and we can help to make sure you don't suffer ANY ill effects). This is downright unethical and dangerous to your organization, so don't tolerate it!

Q6: Do you meet with your clients quarterly as part of your managed services agreement?

Our Answer: Yes. We make it a priority to meet with all our clients at least quarterly (sometimes more often) to provide a "technology review."

In these meetings, we provide you with the status updates of projects we're working on and of the health and security of your network. We also make recommendations for new equipment and upgrades you'll be needing soon or sometime in the near future. Our quarterly meetings with you are C-level discussions (not geek-fests) where we openly discuss your business goals, including your IT budget, critical projects, compliance issues, known problems and cyber security best practices.

Our goal in these meetings is to help you improve operations, lower costs, increase efficiencies and ensure your organizational productivity stays high. This is also your opportunity to give us feedback on how we're doing and discuss upcoming projects.

Cyber Security:

Q7: How do you lock down our employees' PCs and devices to ensure they're not compromising our network?

Our Answer: As above, the question may get a bit technical. The key is that they HAVE an answer and don't hesitate to provide it. Some of the things they should mention are:

- **Defense-in-Depth or Layered-Security** – No one security control is full-proof. That's why we implement what is known in the industry as a defense-in-depth strategy when it comes to cyber-security. That means we implement numerous, complimentary security controls that work in tandem to keep your devices protected.
- **Standard User accounts in Windows instead of Administrator accounts** for day-to-day use. Administrator accounts are only used for administrative purposes like installing and uninstalling software and drivers or changing critical system settings.
- **Multi-factor Authentication (MFA)** is enforced on privileged accounts and all cloud accounts.
- **Endpoint Security** – Endpoint Security goes beyond basic antivirus to provide more comprehensive protection from new and evolving malware and hacking threats.
- Other **system hardening** policies like screen lockouts and passwords policies are applied to all workstations and servers.

Because a combination of these lockdown strategies is essential to protecting your network and data, we employ ALL of these and more for our clients. Effective cyber security should never compromise between choosing this OR that. It should feature every weapon in your arsenal.

Q8: Who audits YOUR company's cyber security protocols and when was the last time they conducted an audit?

Our Answer: Nobody should proofread their own work, and every professional IT consulting firm will have an independent third party reviewing and evaluating their company for airtight cyber security practices.

There are many companies that offer this service, so who they use can vary (there's a number of good ones out there). If they don't have a professional cyber security auditing firm doing this for them on at least a quarterly basis, or if they tell you they get their peers to audit them, DO NOT hire them. That shows they are not taking cyber security seriously.

You can be confident in the effectiveness of our cyber security because we are audited by Galactic Advisors, and we have just recently been audited on 10/12.

Backups And Disaster Recovery:

Q9: Can you provide a timeline of how long it will take to get my network back up and running in the event of a disaster?

Our Answer: There are two aspects to backing up your data that most business owners aren't aware of. The first is "fail over" and the other is "fail back." For example, if you get a flat tire, you would fail over by putting on the spare tire to get to a service station where you can fail back to a new or repaired tire.

If you were to have a disaster that wiped out your data and network – be it a ransomware attack or natural disaster – you want to make sure you have a fail-over solution in place so your employees could continue to work with as little interruption as possible. This fail-over should be in the cloud and locked down separately to avoid ransomware from infecting the backups as well as the physical servers and workstations.

But, at some point, you need to fail back to your on-premise network, and that's a process that could take days or even weeks. If the backups aren't done correctly, you might not be able to get it back at all.

So, one of the key areas you want to discuss with your next IT consultant or firm is how they handle both data backup AND disaster recovery. They should have a plan in place and be able to explain the process for the emergency fail-over as well as the process for restoring your network and data with a timeline.

In this day and age, regardless of natural disaster, equipment failure or any other issue, your business should ALWAYS be able to be operational with its data within six to eight hours or less, and critical operations should be failed over immediately.

We understand how important your data is and how getting your team up and running quickly is essential to your business success. Therefore, in the event of any disaster, we can confidently get your network back up and running in 8 hours or less.

Q10: Do you INSIST on doing periodic test restores of my backups to make sure the data is not corrupt and could be restored in the event of a disaster?

Our Answer: A great IT consultant will place eyes on your backup systems every single day to ensure that backups are actually occurring, and without failures. However, in addition to this, your IT company should perform a monthly randomized "fire drill" test restore of some of your files from backups to make sure your data CAN be recovered in the event of an emergency. After all, the WORST time to "test" a backup is when you desperately need it.

If you don't feel comfortable asking your current IT company to test your backup OR if you have concerns and want to see proof yourself, just conduct this little test: Copy three unimportant files onto a thumb drive (so you don't lose them) and delete them from your server. Make sure one was newly created that same day, one was created a week earlier and the last a month earlier. Then call your IT company and let them know you've lost three important documents and need them restored from

backups as soon as possible. They should be able to do this easily and quickly. If not, you have a problem that needs to be addressed immediately!

Verifying your backups daily and testing them on a regular basis is a cornerstone of a successful overall IT strategy. These are the lengths we go to for all our clients, including multiple random "fire drill" test restores to ensure ALL your files are safe because they are always backed up.

Other Things To Notice And Look For:

Are they good at answering your questions in terms you can understand and not in arrogant, confusing "geek-speak"?

Good IT companies won't confuse you with techno-mumbo-jumbo, and they certainly shouldn't make you feel stupid for asking questions. All great consultants have the "heart of a teacher" and will take time to answer your questions and explain everything in simple terms. As you interact with them in the evaluation process, watch for this.

Our technicians are trained to take time to answer your questions and explain everything in simple terms. Just look at what Cheryl had to say:

"OK Computer has provided our IT services for over 10 years. They are highly reputable and do an excellent job keeping us cyber safe, educating our staff on cyber awareness, and is proactive in making suggestions on streamlining our electronic processes. I would highly recommend OK Computer, Craig is top notch!"

Do they and their technicians present themselves as true professionals when they are in your office? Do they dress professionally and show up on time?

If you'd be embarrassed if YOUR clients saw your IT consultant behind your desk, that should be a big red flag.

How you do anything is how you do everything, so if they cannot show up on time for appointments, are sloppy with paperwork, show up unprepared, forget your requests and seem disorganized in the meeting, how can you expect them to be 100% on point with your IT? You can't. Look for someone else.

Our technicians are true professionals who you would be proud to have in your office. They dress professionally and show up on time, and if they cannot be there on time (for some odd, unforeseen reason), we always notify the client immediately. We believe these are minimum requirements for delivering a professional service.

Do they have expertise in helping clients similar to you?

Do they understand how your business operates the line-of-business applications you depend on? Are they familiar with how you communicate, get paid, service your clients or patients and run your business? We have several small business clients. The reason we work well with them is

because we've been serving Small Businesses in Oklahoma since 2014 and we understand their unique challenges. Here's what Brad had to say:

""

A Final Word And Free Offer To Engage With Us

I hope you have found this guide helpful in shedding some light on what to look for when hiring a professional firm to outsource your IT support to. As I stated in the opening of this report, my purpose in providing this information is to help you make an informed decision and avoid getting burned by incompetent or unethical firms luring you in with cheap prices.

The next step is simple: call my office at 1-405-252-9691 and reference this letter to schedule a brief 10- to 15-minute initial consultation.

On this call we can discuss your unique situation and any concerns you have and, of course, answer any questions you have about us. If you feel comfortable moving ahead, we'll schedule a convenient time to conduct our proprietary 20-Point IT Systems Assessment.

This Assessment can be conducted 100% remote with or without your current IT company or department knowing (we can give you the full details on our initial consultation call). **At the end of the Assessment, you'll know:**

- Where you are overpaying (or getting underserved) for the services and support you are currently getting from your current IT company or team.
- Whether or not your systems and data are *truly* secured from hackers and ransomware, and where you are partially or totally exposed.
- If your data is *actually* being backed up in a manner that would allow you to recover it quickly in the event of an emergency or ransomware attack.
- Where you are unknowingly violating PCI-DSS.
- How you could lower the overall costs of IT while improving communication, security, and performance, as well as the productivity of your employees.

Fresh eyes see things that others cannot – so, at a minimum, our free Assessment is a completely cost- and risk-free way to get a credible third-party validation of the security, stability, and efficiency of your IT systems.

To Schedule Your Initial Phone Consultation:

See What Other Business Owners Are Saying:

OK Computer has provided our IT services for over 10 years. They are highly reputable and do an excellent job keeping us cyber safe, educating our staff on cyber awareness, and is proactive in making suggestions on streamlining our electronic processes. I would highly recommend OK Computer, Craig is top notch! – Cheryl Ferguson, FER Inc.

OK Computer has been taking care of all our computers for several years now, and we have no complaints. Craig is a genius! - Brad C., Rapid Wash

I am very thankful that I found this computer service company to help me with my computer issues. Craig was very quick to refer me to a simple inexpensive device that I could buy through Amazon to hook up to my old hard drive to access and save all my data. He even provided the link with the exact product I needed. This is the top notch kind of service that I so appreciate and is the kind of service that will definitely bring me back as a regular customer. Thank you Craig, you are a huge blessing! I would highly recommend this computer service company! – Michele W

The Top 4 Reasons Why You'll Want To Outsource Your IT Support To Us:

1. **Peace Of Mind.** Because we monitor all of our clients' networks 24/7/365, you never have to worry that a virus has spread, a hacker has broken in or a backup has failed to perform. We watch over your entire network, taking the management and hassle of maintaining it off your hands. This frees you to focus on your customers and running your business, not on your IT systems, security and backups.
2. **Lower Costs, Waste And Complexity With Cloud Solutions.** By utilizing cloud computing and other advanced technologies, we can eliminate the cost, complexity and problems of managing your own in-house server while giving you more freedom, lowered costs, tighter security and instant disaster recovery.
3. **No Geek-Speak.** You deserve to get answers to your questions in PLAIN ENGLISH, not in confusing technical terms. Our technicians will also not talk down to you or make you feel stupid because you don't understand how all this "technology" works. That's our job!
4. **We Won't Hold You Hostage.** Many IT companies do NOT provide their clients with simple and easy-to-understand documentation that outlines key network resources, passwords, licenses, etc. By keeping that to themselves, IT companies hold their clients "hostage" to scare them away from hiring someone else. This is both unethical and unprofessional. As a client of ours, we'll provide you with full, written documentation of your network and all the resources, software licenses, passwords, hardware, etc., in simple terms so YOU can understand it. We keep our clients by delivering exceptional service -- not by keeping them in the dark.
